Technical Bulletin

Welcome

Welcome to the January 2008 issue of the Websydian technical bulletin. The technical bulletins contain important technical information from the Websydian Development Team.

WSDL/Scheme import beta release

Websydian WSDL/Schema Import is currently available in a beta version for testing and feedback from you before final release.

Currently only the schema import part is supported in the beta release, WSDL import is in the process of design.

Please go to the site http://groups.google.com/group/wsdlschema-import-beta. Apply for group membership and follow the directions in the welcome document.

We will be happy to have any feedback you may have on the beta.

Improved runtime for Websydian Server

We have improved the runtime of the Websydian Server significantly.

Please contact Websydian Support to obtain latest version of the Websydian Server runtime.

WebsydianExpress v2.1

A service release for WebsydianExpress is now available.

This service release includes among other things the following:

1. Improved performance of load site structure by use of a lazy-load
2. Properties on Presentations. Option for configuring the Business Processes using name value pairs for input parameters. This also includes a number of new API's for Plex, 2E and RPG developer.
3. Fix of minor bugs introduced in WebsydianExpress v2.0
4. Fixed templates in the administration interface, IE 7.0 problems.

Contact Websydian Support to obtain the upgrade for WebsydianExpress v2.0.

Websydian Express v2.1 for Plex v6.0

With the service release we also release a variant for Plex v6.0. This is for the Windows versions because of the missing backward compatibility on the Plex Windows runtime.

If upgrading from Plex 5.5SP1 to Plex 6.0 and using one of the Windows variants of Websydian Express, you will need to generate and build all your business processes.

A major improvement with Plex v6.0 is performance because of the changes made in Plex v6.0 on unloading DLL's.

Best regards,

Niels P. Soerensen, Manager, Websydian Support
